

SKYVIEW SOLUTIONS

SATELLITE, AERIAL & LAND IMAGING SERVICES

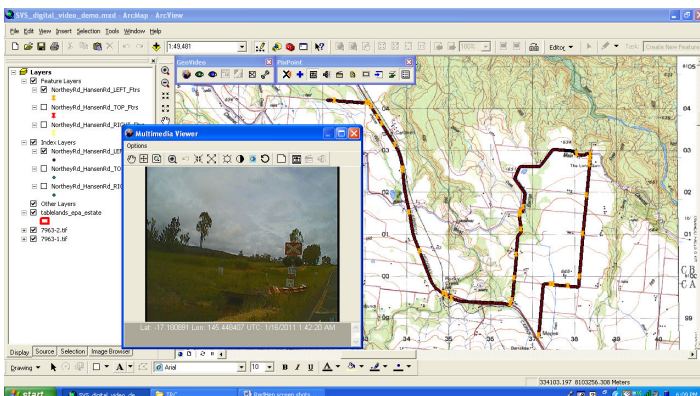

VIDEOGRAPHY SERVICES

SkyView Solutions operates specialist videography equipment for geo-referencing footage recorded from up to 4 cameras simultaneously. The video cameras, GPS and hard drive recorder are compact and rugged and can be attached to a range of vehicles including ATVs, 4WDs, golf buggies and boats.

Our software package is a geospatial multimedia mapping application that digitally maps video, photographs and audio content using GPS coordinates. We can also load background topographic maps, aerial or satellite imagery into the digital map set. Combining time, date and location with audiovisual content is a powerful tool ensuring efficient and effective management of infrastructure and monitoring of temporal changes to the landscape.

We can tailor the data output to match your existing GIS software package or convert it for viewing in web-based applications like Google Earth.

Potential uses of this technology include:

- Mapping of remote tracks and trails using the video to extract location and still images of key features such as gates, grids, bridges, shelters, culverts, drains, roads, signs and weeds.
- Mapping of rivers to identify changes in geomorphology, riparian vegetation and success of rehabilitation zones.
- Video mapping of powerlines and other utilities to geo-reference infrastructure and assess the conditions of access tracks.
- Using thermal lenses to monitor conveyors to predict bearing failures, allowing for more efficient servicing.
- Video mapping of footpaths to assist councils identify hazards and establish a priority-based maintenance schedule.
- And more... please contact us. We are happy to explore solutions to a range of management problems.

For further information on this innovative technology please [contact us](#).
